(PSP)

Upper (WMS / GMS)
Ratio Image

Segmented SN$_C$
(Upper Slice)
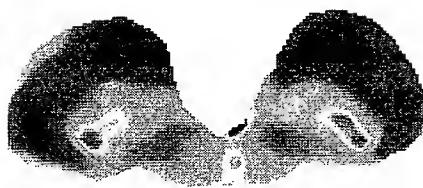

Lower (WMS / GMS)
Ratio Image

Segmented SN$_C$
(Lower Slice)

Imaging of the substantia nigra pars compacta (SN$_C$) in Progressive
Supranuclear Palsy (PSP). The left column shows the (WMS / GMS) ratio
images of upper and lower slices and the right hand side displays the SN$_C$
segmented from the WMS images of the cerebral peduncle. Images are
displayed using the pseudo color lookup table on the right. Note that the
gradient of signal is in the opposite direction to that seen in Parkinson's
disease (i.e. there is relative loss of signal medially). This suggests the
possibility of distinguishing the two forms of parkinsonism radiographically.

FIG. 3
